I.-Subject Identification	
Type	OBLIGATORIA
Teaching period	2 course, 1Q semester
Nº of credits	6
Language in wich the subject is taught	English

II.-Presentation

Probability and **Statistics** form a fundamental basis for the construction of procedures, methodologies, designs, tools and algorithms, present in many of the specific subjects that a Biomedical Engineering undergraduate undertakes in its training process.

–

The main training objectives of the subject of Probability and Statistics are:

- Highlight the importance of **probabilistic models** (and their differences from deterministic models) very common in engineering and biomedicine, to describe systems that show unpredictable variations or randomness.
- Provide the student with the ability to define probabilistic models to solve engineering problems, with special attention to biomedical applications.

Prerequisites and recommendations: it is convenient for the student to have taken the **Calculus**, **Algebra and Mathematical Methods of Bioengineering** subjects so that you have knowledge about real functions of a variable and multiple variables, sequences and series of functions, multiple differentiation and integration, vector spaces, linear applications and linear systems. In order to facilitate the passing of the subject and the achievement of the training objectives, students are **recommended to read previously the contents of each session of the course**, to complete the activities proposed in class and to solve the problems proposed in the recommended bibliography, as well as **attending tutorials** whenever necessary.

How the course works for students taking this course at the Alcorcón campus: Students will be able to remotely attend the classes and/or practicals (if the situation allows it) or in-person groups taught in the Fuenlabrada Campus. Tutorials, as usual, by previous appointment. Tutorials can be online if required.

III.-Learning outcomes

CG01 . Analyze and synthesize problems related to biomedical engineering, solve them and communicate them efficiently.
CG02. Use computational and experimental tools for the analysis and quantification of biomedical engineering problems
CB1. Proven knowledge and understanding of an area of study based on general secondary education and at a level which, although supported by advanced text books, also includes certain aspects that imply knowledge from the forefront of the field of study.
CB5 . That students have developed the learning skills needed to undertake further studies with a considerable degree of autonomy.
CE02. Perform statistical analysis for the study, analysis and control of experiments and medical data.
CE06. Know, use and design systems for the analysis of large biomedical data sets, from knowledge extraction to visualization.

- Key for degrees not adapted to RD 822/21: **CB** - basic competences, **CG** - generic competences, **CE** - specific competences, **CT** - transversal competences.
- Key for degrees adapted to RD 822/21: **CON** - knowledge, **COM** - competences, **HAB** - skills.

IV.-Contents

IV.A.-Syllabus

Part 1: Introduction

Module 1. Probability Models in Engineering
1.1 Mathematical Models as Tools in Analysis and Design
1.2 Deterministic Models
1.3 Probability Models
1.3.1 Statistical Regularity
1.3.2 Properties of Relative Frequency
1.3.3 The Axiomatic Approach to a Theory of Probability
1.3.4 Building a Probability Model

Module 2. Basic Concepts of Probability Theory
2.1 Specifying Random Experiments
2.1.1 The Sample Space
2.1.2 Events
2.1.3 Review of Set Theory
2.1.4 Event Classes
2.2 The Axioms of Probability
2.2.1 Discrete Sample Spaces
2.2.2 Continuous Sample Spaces
2.3 Conditional Probability
2.3.1 Bayes' Rule
2.4 Independence of Events
2.5 Sequential Experiments
2.5.1 Sequences of Independent Experiments
2.5.2 The Binomial Probability Law
2.5.3 The Multinomial Probability Law
2.5.4 The Geometric Probability Law
2.5.5 Sequences of Dependent Experiments

Part 2: Random Variables
Module 3. Discrete Random Variables
3.1 The Notion of a Random Variable
3.2 Discrete Random Variables and Probability Mass Function
3.3 Expected Value and Moments of Discrete Random Variable
3.3.1 Expected Value of Functions of a Random Variable
3.3.2 Variance of a Random Variable
3.4 Conditional Probability Mass Function
3.4.1 Conditional Probability Mass Function
3.4.2 Conditional Expected Value
3.5 Important Discrete Random Variables
3.5.1 The Bernoulli Random Variable
3.5.2 The Binomial Random Variable
3.5.3 The Geometric Random Variable

Q2803011B UNIVERSIDAD REY JUAN CARLOS
Fecha firma: 20/11/2026 16:15 | Hash: 285a7780d9447e5b30d5fb48f3055ce8.

3.5.4 The Poisson Random Variable
3.5.5 The Uniform Random Variable

Module 4. One Random Variable
4.1 The Cumulative Distribution Function
4.1.1 The Three Types of Random Variables
4.2 The Probability Density Function
4.2.1 pdf of Discrete Random Variables
4.2.2 Conditional cdf's and pdf's
4.3 The Expected Value of X
4.3.1 The Expected Value of Y = g(X)
4.3.2 Variance of X
4.4 Important Continuous Random Variables
4.4.1 The Uniform Random Variable
4.4.2 The Exponential Random Variable
4.4.3 The Gaussian (Normal) Random Variable
4.4.4 The Gamma Random Variable
4.4.5 The Beta Random Variable
4.4.6 The Cauchy Random Variable
4.4.7 The Pareto Random Variable
4.5 Functions of a Random Variable
4.6 The Markov and Chebyshev Inequalities
Module 5. Pairs of Random Variables
5.1 Two Random Variables
5.2 Pairs of Discrete Random Variables
5.2.1 Marginal Probability Mass Function
5.3 The Joint cdf of X and Y
5.3.1 Random Variables That Differ in Type
5.4 The Joint pdf of Two Continuous Random Variables
5.5 Independence of Two Random Variables
5.6 Joint Moments and Expected Values of a Function of Two Random Variables
5.6.1 Expected Value of a Function of Two Random Variables
5.6.2 Joint Moments, Correlation, and Covariance
5.7 Conditional Probability and Conditional Expectation
5.7.1 Conditional Probability
5.7.2 Conditional Expectation
5.8 Functions of Two Random Variables
5.8.1 One Function of Two Random Variables
5.8.2 Transformations of Two Random Variables
5.8.3 pdf of Linear Transformations
5.9 Pairs of Jointly Gaussian Random Variables
Module 6. Vector Random Variables
6.1 Vector Random Variables
6.1.1 Events and Probabilities
6.1.2 Joint Distribution Functions
6.1.3 Independence
6.2 Functions of Several Random Variables
6.2.1 One Function of Several Random Variables
6.2.2 Transformations of Random Vectors
6.3 Expected Values of Vector Random Variables
6.3.1 Mean Vector and Covariance Matrix
6.3.2 Linear Transformations of Random Vectors

Q2803011B UNIVERSIDAD REY JUAN CARLOS
Fecha firma: 20/11/2026 16:15 | Hash: 285a7780d9447e5b30d5fb48f3055ce8.

6.4 Jointly Gaussian Random Vectors
Module 7. Sums of Random Variables and Long-Term Averages
7.1 Sums of Random Variables
7.1.1 Mean and Variance of Sums of Random Variables
7.1.2 pdf of Sums of Independent Random Variables
7.2 The Sample Mean and the Laws of Large Numbers
7.3 The Central Limit Theorem
7.3.1 Gaussian Approximation for Binomial Probabilities
Part 3: Random Processes
Module 8. Random Processes
8.1 Definition of a Random Process
8.2 Specifying a Random Process
8.2.1 Joint Distributions of Time Samples
8.2.2 The Mean, Autocorrelation and Autocovariance Functions
8.2.3 Multiple Random Processes
8.3 Discrete-Time Processes: Sum Process, Binomial Counting Process, and Random Walk
8.3.1 iid Random Process
8.3.2 Independent Increments and Markov Properties of Random Processes
8.3.3 Sum Processes:The Binomial Counting and Random Walk Processes
8.4 Stationary Random Processes
8.4.1 Wide-Sense Stationary Random Processes
8.4.2 Wide-Sense Stationary Gaussian Random Processes
8.5 Time Averages of Random Processes and Ergodic Theorems

IV.B.-Training activities

Type	**Title**
Theoretical sessions	Classroom lessons in which theoretical contents are introduced along with examples and exam type problems.
Experimental and/or technological laboratories	Practical cases where the students learn to use their own code after finishing each topic
Resolution of exercises, problems, case studies	Problem solving after finishing each thematic module

Q2803011B UNIVERSIDAD REY JUAN CARLOS
Fecha firma: 20/11/2026 16:15 | Hash: 285a7780d9447e5b30d5fb48f3055ce8.

V.-Student workload	
Theoretical sessions	30
Resolution of exercises, problems, case studies, etc.	18
Practical sessions in experimental, technological and clinical laboratories, fieldwork, etc.	8
Tests and/or exams	4
Academic tutorials	44
Related activities: conferences, seminars, etc.	4
Preparation of theoretical sessions and self-study	20
Preparation of practical tasks, exercises, case studies, projects, etc.	20
Preparation for tests and/or exams	32
Total student workload	180

VI.-Methodology and academic programme

Type	Period	Content
Theoretical sessions	Week 1 to Week 14	A detailed explanation of the concepts fundamentals together with problemsolving
Practical sessions	Week 8 to Week 14	Practical exercises using code
Seminars	Week 1 to Week 14	Attendance at recommended seminars due to its relationship with the degree and/or the subject.
Tests and/or exams	Week 7 to Week 17	Progressive evaluation of content comprehension.

Q2803011B UNIVERSIDAD REY JUAN CARLOS
Fecha firma: 20/11/2026 16:15 | Hash: 285a7780d9447e5b30d5fb48f3055ce8.

VII.-Assessment methods

The general assessment method is continuous as established in the *Regulation for the Assessment of Learning Outcomes* of Rey Juan Carlos University.
All the assessment systems established in the degree report must be employed, except for those that have a minimum weight of 0%, which can be used by professors in the academic years they consider relevant. Each assessment system may be applied through one or more assessment activities, consistent with the system. No assessment activity can exceed individually 60% of the overall grade for the subject.
The sum of non re-evaluable activities cannot exceed 40% of the overall grade for the subject and, in general, should not have an established minimum grade (except for practical activities in which, strictly speaking, the conditions of the ordinary call cannot be reproduced in the extraordinary call).
Those students who do not manage to pass the subject in the ordinary call, or do not attend this first call, may attend the extraordinary call only for failed re-evaluable assessment activities.
The distribution and characteristics of the assessment activities are described below.

VII.A.-Description and weight of the assessment activities

Q2803011B UNIVERSIDAD REY JUAN CARLOS
Fecha firma: 20/11/2026 16:15 | Hash: 285a7780d9447e5b30d5fb48f3055ce8.

Continuous ordinary assessment:
The distribution and characteristics of the assessment tests are those described below. Only in exceptional cases and for special reasons may the teacher add changes to the Guide. These changes will require the prior consultation with the Subject Head and the prior and explicit authorisation of the Degree Programme Coordinator, who will notify the Vice-Rector's office in charge of Academic Affairs of the modifications made. In any case, the changes proposed must take into account the stipulations of the verified report. In order for these changes to take effect, they must be duly communicated at the start of the course to the students using Aula Virtual.
The combination of activities that are not re-assessable cannot exceed 50% of the subject grade and, in general, cannot have a minimum grade (except for the case of laboratory or clinical work placements, where duly justified), and tests which exceed 60% of the subject weighting cannot be added.
Extraordinary assessment: Students who do not manage to pass the ordinary assessment, or who did not attend, will be subject to completion of an extraordinary assessment to verify their acquisition of the skills established in the guide, only for activities that are re-assessable.

Regular assessment

The regular assessment of the course consists of the evaluation of the following three activities:
1. Laboratory/exercises: 20% of the final mark. To facilitate following and preparing the course, a series of practical activities and exercises will be assigned throughout the semester, mainly at the end of each topic or content block. In particular, attendance at, completion of, and submission of the exercises and practical sessions carried out in the computer laboratory are compulsory. These activities are also non-reassesable. Specifically, there will be three graded activities, each carrying the same weight in the final course grade. Attendance will be monitored using the attendance tool available in the URJC App. Together, these activities account for 20% of the final course grade. There is no minimum passing mark required for these activities. The publication of and submission process for exercises and practical assignments will be managed through the Virtual Classroom.
2. First written test: 40% of the final mark. In the same way, to facilitate the following of the subject, the first written test will include the contents of the first lessons defined in the section Contents. This test is compulsory, re-assessable and eliminates the contents of the final written test. To pass it, a minimal qualification of 5/10 will be needed.
3. Second written test: 40% of the final mark. In this second compulsory written test, the rest of the contents of the subject will appear. This test is compulsory, re-assessable and eliminates contents. To pass it, a minimal qualification of 5/10 will be needed.

Extraordinary assessment

In the extraordinary evaluation, those evaluation activities classified as reassessable in the ordinary evaluation will be carried out again, also keeping all its characteristics. Therefore, the extraordinary evaluation will consist of two parts, corresponding to the reassessment of the two written tests, which will have the same weight and the same minimum mark specified in the ordinary evaluation. In this way, to pass the course, each student must complete and pass the reassessment test or tests corresponding to that or those written tests that have not been passed in the ordinary evaluation period.

Revision of final written exams

The following rules will be applied in the revision of the final written exams.
1. The evaluation criteria established by the teacher cannot be discussed during the revision process of the final written exam. Revision of the final written exam cannot include doubt-solving activities. It should focus on solving inconsistencies in the assessment of the final written exams.
2. To be admitted to the revision process students must provide the solution to the final written exams. Those problems for which students do not provide the solution will not be discussed during the review process.
3. The resolution of doubts about problems or questions in the final written exams will be treated in a tutorial which will take place upon request of the students.
4. Plagiarism in any phase of the evaluation process will be sanctioned according to the "Normativa sobre conducta académica de la Universidad Rey Juan Carlos".

Class Attendance

Given the practical work methodology of the subject, attendance at classes is not only recommended but also a mandatory activity. However, there is the possibility of requesting academic dispensation. Attendance will be verified using the URJC app.

Q2803011B UNIVERSIDAD REY JUAN CARLOS
Fecha firma: 20/11/2026 16:15 | Hash: 285a7780d9447e5b30d5fb48f3055ce8.

VII.B. Assessment of students with academic exemption from class attendance

Having Academic Exemption from Class Attendance (DAAC) does not imply that students are automatically exempt from participating in the continuous assessment activities or in the training activities of compulsory attendance as established in the teaching guide. Once the exemption has been granted, students must contact the subject's teaching staff, who will propose the adaptations he/she may consider relevant, as long as they guarantee the acquisition and adequate assessment of the learning goals established. Students must maintain adequate communication with the teaching staff so that they may provide information on the dates for training and assessment activities, if these are not established in the programme and available for students at the time of achieving the exemption.
Subject with possibility of academic exemption: Yes.

VII.C. Review of assessment activities

In accordance with the Regulation for the Assessment of Learning Outcomes of Rey Juan Carlos University.

VII.D.-Students with a disability or special educational needs

In order to guarantee equal opportunities, non-discrimination, universal accessibility and academic success, students with disabilities or especial education needs may request curricular adaptations to follow their studies. These adaptations will be provided by the Unit of Attention to People with Disabilities of Rey Juan Carlos University, in accordance with the regulation which regulates the service for the Attention of People with Disabilities at the University. This Unit will issue a report for curricular adaptations, so that students with disabilities or special education needs must contact the service (at e-mail discapacidad.programa@urjc.es) in order to provide relevant information for different educational alternatives.

VII.E.-Academic behaviour, academic integrity and honesty

Rey Juan Carlos University is fully committed to the highest standards of academic integrity and honesty, so studying at the URJC means assuming and subscribing to the values of integrity and academic honesty set out in the University's Ethical Code. To support this process, the University has Rey Juan Carlos University's Academic Conduct Regulation as well as different tools (anti-plagiarism, supervision...) that offer a collective guarantee for the full development of these essential values.
